

Self Review Note

What I Learned:

On the first day, learnt what Playwright is, and started to learn TypeScript from the basics to understand how scripting is done. Also learnt the format for writing manual test cases.

During Day 2 and Day 3, I gained hands-on experience with Playwright automation using TypeScript. I learned how to create and organize test cases for login, products, cart, and checkout functionalities. I understood the importance of reusable code and implemented the Page Object Model (POM) to improve framework structure and maintainability. I also learned how `async/await` works, how hooks like `beforeEach()` help reduce repetitive code, and how helper functions can simplify reusable workflows.

Errors Faced and How I overcame them:

Day 2

Failed Test : TC_005: All products should be displayed

Reason for Failure: The test was failing because the assertion was using the `products.length` from the `products.ts` file. The `products.ts` file contained only 2 products while the SauceDemo website actually displayed 6 products on the inventory page.

Fix Applied: I updated the assertion to validate the actual product count (6) displayed on the website instead of using the local test data array length.

Day 3

Faced issues while refactoring tests into POM structure because some objects were initialized outside the test scope. Solved it by creating page object instances inside hooks and tests.

Encountered assertion failures due to case-sensitive text mismatches. Fixed them by checking the exact UI text and updating assertions accordingly.

Faced TypeScript errors while using assertions directly on locators inside page classes. Solved them by wrapping assertions with `expect()`.

Things I would like to improve:

Improve my understanding of TypeScript concepts

Improve debugging speed and reduce dependency on trial and error fixes

Self Review

I was able to move from writing basic automation scripts to creating a structured automation framework using the Page Object Model. Although I wasn't well-versed with typescript, with the help of documentation and some notes, got familiar with it and improved my debugging skills, learned how to investigate failures using Playwright reports and terminal logs, and understood the importance of reusable and maintainable code.
