

Debugging Note

Failed Test :

TC_005: All products should be displayed

Reason for Failure:

The test was failing because the assertion was using the `products.length` from the `products.ts` file. The `products.ts` file contained only 2 products while the SauceDemo website actually displayed 6 products on the inventory page.

How I investigated it:

I ran the test in Playwright UI mode and checked the failed assertion details in the terminal output. I compared the expected product count with the actual number of product cards displayed on the website.

Tools Used:

Playwright UI mode

Playwright HTML Report

Fix Applied:

I updated the assertion to validate the actual product count (6) displayed on the website instead of using the local test data array length.

Learning:

The issue helped me understand that application validations should match the actual UI behavior and data. Data files should not always be directly used for UI count validations unless they represent the whole application data.
